Which comments should a moderator see first?

I built an AI-assisted review prototype and labelled 260 archived TikTok comments using a rubric based on TikTok's public guidelines. I tested whether surrounding text helps identify violations and whether a different queue order helps reviewers reach them in time.

Imagine 16 comments are waiting. A moderator has time to read two.

Model C read each comment and its caption, then sorted them by review score.

1st	An affectionate joke about a chubby corgi	**Would read**
2nd	Reassurance about the creator's appearance	**Would read**
5th	The writer said their mother would hit the other person.	**Still waiting**

The examples above are paraphrased. I labelled the fifth comment a violation because it described harm directed at someone, though the writer's tone was unclear. Model C flagged it too, but four comments scored higher. The moderator would read the two harmless comments and stop.

Two product decisions

1. Keep the context model in offline testing.

On ten validation comments, the comment-only model flagged four of eight harmless comments. Adding the caption and available parent comment reduced this to one. Both models caught the two violations. Those same two cases helped set the alert threshold.

2. Keep the existing queue order.

A rule could move one physical-harm alert to the front. It moved the known case from fifth to first on replay. On two fresh batches of 40, both methods selected the same five comments per batch. The change showed no gain at that review capacity.

What I would test next

I would ask independent reviewers to label fresh English comments for violation, severity and missing context before seeing model scores. At equal staffing and review capacity, I would count serious cases gained and displaced by each order. Reviewer handling times would show whether the simulated budget reflects an actual shift.

One reviewer supplied the original labels. The archived sample is small and partly selected for challenging wording. Operational and multilingual performance still need independent evaluation.
